EXERCISE 15 - ADVANCED TURNS

AIM To Learn how to turn the aircraft at a high rate in level flight, maintaining height.

AIRMANSHIP Lookout, Lift wing, Check Behind, Orientation, Safety Checks, P.O.H , G

EXERCISE Revision of Medium Level Turns

360°

ENTRY

LOOKOUT

Bank - Ailerons, as A.O.B >30°
Increase Power **100rpm** for a 45° A.O.B Turn

For a 60° A.O.B Turn >30°
Increase to **Full** Power

Balance - Rudder

Back Pressure - Elevator

To maintain height the greater the A.O.B the more back pressure required

If High R.O.D/ I.A.S/ A.O.B

Recovery from a Spiral Dive

- Close Throttle
- Relax any back pressure and roll wings level
- Ease out of dive
- A/C Nose above horizon as I.A.S reduces <80kts Increase to full power - climb away **(RED LINE!)**

DURING

LOOKOUT

Bank - Mainain A.O.B

Balance -

Back Pressure - Monitor height and speed

-60° A.O.B Turn

If A.O.B good but too much back pressure you will climb **so relax a little back pressure.**

If A.O.B good but not enough back pressure you will descend. **Roll off a little A.O.B** to stop descent, when you increase the A.O.B again, remembering to add a little more back pressure

EXIT

LOOKOUT

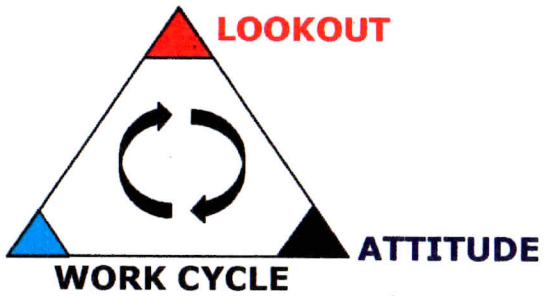
Bank - Roll Wings Level

< 30° A.O.B Reduce Power 2300rpm

LISTEN

Balance -

Back Pressure - Relax

As Aircraft rolls out when you relax the back pressure from a 60° A.O.B turn, you will need to push a little on the control column to achieve S+L Picture.


DO LEFT AND RIGHT TURNS 360°
